University of Michigan**

### ABSTRACT:

Although ceramic materials with superionic conductivities ( $> 10^{-3}$  S/cm) have been reported for pellets or sheets, no such examples exist for thin films ( $< 100$   $\mu\text{m}$ ). Also, almost all superionic conductivities are observed in materials produced via glass-ceramic processing method. However, to convert glass-ceramic sheets (1-2 mm) to thin films ( $< 100$   $\mu\text{m}$ ), they are ball-milled, tape cast, and sintered to give conductivities of  $> 10^{-4}$  S/cm. Similar conductivities ( $> 10^{-4}$  S/cm) have been obtained for thin films produced using sol-gel derived powders. Nonetheless, sol-gel processing requires calcining powders producing hard agglomerates that are only eliminated using high-energy milling. We demonstrate here that liquid-feed flame spray pyrolysis (LF-FSP) processing provides non-agglomerated nanopowders that can be used immediately to tape cast.  $\text{Li}_{1+x+y}\text{Al}_x\text{Ti}_{2-x}\text{Si}_y\text{P}_3\text{-yO}_{12}$  ( $x = 0.1, 0.3/y = 0.2, 0.4$ ) nanopowders were prepared by LF-FSP with a primary focus on the effects of  $\text{Al}_{0.3}/\text{Si}_{0.4}$  doping on conductivities. Furthermore, the effects of excess  $\text{Li}_2\text{O}$  on  $\text{Al}_{0.3}/\text{Si}_{0.4}$  doped materials were studied.  $\text{Li}_{1.7}\text{Al}_{0.3}\text{Ti}_{1.7}\text{Si}_{0.4}\text{P}_{2.6}\text{O}_{12}$  pellets sintered to 93-94 % of theoretical density and samples with varying excess  $\text{Li}_2\text{O}$  contents all show superionic conductivities of  $2\text{-}3 \times 10^{-3}$  S/cm at room temperature.  $\text{Li}_2\text{O}$  lowers both the crystallization temperatures and temperatures required to sinter. Total conductivities range from  $2 \times 10^{-3}$  to  $5 \times 10^{-2}$  S/cm in the temperature span of  $25^\circ$  to  $125^\circ\text{C}$ . Small grain sizes of  $600 \pm 200$  nm were produced consistently. Initial attempts to make sturdy, free-standing thin films gave films with thicknesses of  $52 \pm 1$   $\mu\text{m}$  on sintering just to  $1000^\circ\text{C}$ . Measured conductivities were  $3\text{-}5 \times 10^{-4}$  S/cm; attributed to final densities of only  $\approx 88\%$ .

### 略歴:

1969年カリフォルニア州立大学化学部卒。1973年南カリフォルニア大学博士号（化学）取得。デラウェア大、UCサンタバーバラ、スタンフォード国際研究所研究員を経て1987年ワシントンテクノロジーセンター研究教授、1990年からミシガン大学物質科学工学部教官。1999年同大教授。Mayaterials 創設者兼CEO、高分子科学工学センター統括者、EXIMOハードコーティング社共同創設者。

**Date: June 26 (Thu), 2014 13:00~14:30**
